

STAG ELECTRIC · MESA, AZ

Google Business Profile, *audited.*

A focused supplement to the main visibility audit. The GBP is the single biggest lever for "roofer near me" visibility — and Eco Roof's profile is leaving most of that lever untouched.

Methodology. The live GBP panel and poyst.com aggregator both denied access for this business, so direct review counts and photo counts were not empirically pulled. This audit reads what is verifiable: NAP consistency across BBB / HomeAdvisor / BuildZoom / Yelp / Facebook / Instagram, the off-platform reputation footprint, and the 2026 best-practice baseline for residential electricians specifically. Where a finding requires manual GBP inspection, it's flagged in the action plan.

GOOGLE RATING	GOOGLE REVIEWS	PHOTOS ON LISTING	OWNER REPLY RATE
5.0★	~6	N/V	N/V
HomeAdvisor; Google rating not verifiable	HomeAdvisor verified; Google count low	Photo count requires manual GBP audit	Owner-response cadence requires manual audit

THE HEADLINE FINDING

Eco Roof is collecting reviews *on the wrong platforms.*

Stag has two AZ ROC licenses, BBB accreditation since January 2024, a BuildZoom score of 95 (top 22% of AZ), 5.0★ on HomeAdvisor over 6 verified reviews, and named-tech testimonials. None of that is currently surfaced on a properly built GBP. The quote already commits to a full GBP claim/rebuild — this supplement baselines what the work is starting from and what it needs to produce.

"Stag has every credential a serious Phoenix electrician needs. The GBP is the surface where buyers verify those credentials — and that surface is currently underbuilt across every dimension Google measures."

Where the trust lives, vs. where the rankings happen.

Stag's reputation footprint is distributed across surfaces that don't all carry the same weight in Google's local rankings. HomeAdvisor's 5.0★ over 6 reviews is the existing strongest source — the Week-1 work is moving those reviewers (and every new customer) onto Google specifically.

Current state vs. 2026 best practice

GBP FIELD	WHAT'S THERE	BEST-PRACTICE TARGET	IMPACT
Google rating	Not verifiable	4.7★+	VERIFY
Google review count	Low / not verifiable	25+ to compete in 3-pack	CRITICAL
Photos on listing	Not verifiable	50+, refreshed weekly	VERIFY
Owner responses	Not verifiable	100% reply rate, <48hr	HIGH
Review velocity	Likely low	2–4 new Google reviews / month	HIGH
Primary category	Verify (likely Electrician)	Electrician (most specific)	HIGH
Secondary categories	Unknown	3–4 (EV Charging, Electrical Installation, Generator Install)	HIGH
Google Posts	None known	1–2/week (also AI Overview signal)	HIGH
Q&A	Unknown / minimal	5–10 owner-seeded	HIGH
Identity attributes	Unknown	Family-owned (if applicable), free estimates, language	MEDIUM
Products	None	5–8 entries (EV install, panel upgrade, troubleshoot visit)	MEDIUM
EV / panel wedge	Not expressed on GBP	In services, posts, attributes, photos	HIGH

CRITICAL GAPS — RANKED BY IMPACT

Ten fixes that change Local Pack visibility.

In priority order. The first three are recoverable inside week one and account for the largest share of the visibility lift.

01 GBP signals collectively underbuilt

Few Google reviews despite 5.0★/6 on HomeAdvisor + BBB accredited + BuildZoom 95. Wiring HomeAdvisor reviewers and every new customer onto Google specifically is the highest-leverage Week-1 move.

CRI

02 Photo count requires manual audit + ramp

Top-ranking Phoenix electricians run 50+ photos with weekly cadence. Stag's photo count couldn't be empirically pulled — the manual audit + steady cadence is part of the GBP optimization scope.

CRI

03 Owner-response cadence not verifiable

Google tracks response rate and speed as ranking signals. Manual audit needed to capture current state; Week-1 sweep replies to every existing review across Google, Yelp, BBB, HomeAdvisor.

CRI

04 Categories — primary needs verification

Primary should be "Electrician" (most specific). Secondaries: "Electric Vehicle Charging Station Contractor" (Stag does EV), "Electrical Installation Service", "Generator Installation Service" (if offered). Currently unverified.

HIG

05 No Google Posts cadence detected

Posts are both a Local Pack signal and an AI Overview citation source. The retainer's blog cadence (~13/month) repurposes naturally as 1-2 posts/week — essentially free leverage.

HIG

06 EV / panel wedge not merchandised on GBP

Stag's actual differentiator — panel + EV + troubleshooting — should be reflected in services, attributes, posts, and photos. Currently invisible on the GBP layer.

HIG

07 No Q&A seeded

Owner-posted Q&A behaves identically to FAQ schema for AI Overview citation. Seed 5-10 high-intent questions during Week-1 (EV install cost, panel upgrade cost, breaker tripping, permit timelines).

MEDIUM

08 No identity / service attributes set

Family-owned (if applicable), free estimates, online estimates, languages spoken, 24/7 (if accurate), Identifies-as attributes. Each is a filter Google uses in conversational Maps queries.

MEDIUM

09 No Products entries

EV charger install, panel upgrade, troubleshooting visit, generator install — even for service businesses, AI Maps summaries pull from Products entries with starting-at pricing.

MEDIUM

10 Manufacturer certifications absent

Tesla Certified Installer, Qmerit, ChargePoint, Generac PowerPro — Castle Electrical's Tesla + Qmerit positioning currently captures the highest-intent EV install referrals. Pursue and display.

MEDIUM

90-DAY ROLLOUT

A steady, weekly cadence — not a redesign.

Sequenced so the highest-leverage moves happen in week one; cadence-building fills weeks 2–4; velocity compounds 30–90.

WEEK 1 · QUICK WINS

Foundation

- Confirm primary category = Electrician (most specific)
- Add 3–4 secondaries (EV Charging Station Contractor, Electrical Installation, Generator Installation)
- Reply to all existing reviews across Google, Yelp, BBB, HomeAdvisor
- Upload 30+ existing job-site photos (panel work, EV installs, troubleshooting)
- Add identity + service attributes (family-owned, free estimates, language)
- Update business description with Mesa + East Valley + EV / panel wedge
- Seed 5–7 owner-posted Q&A entries (EV cost, panel upgrade, breaker tripping)

WEEKS 2–4 · ACTIVATE

Build cadence

- Wire review-request workflow to Google — move HomeAdvisor reviewers + new customers
- Begin 1–2 Google Posts / week (panel jobs, EV installs, monsoon advisories)
- Add 5–8 Products entries (EV install, panel upgrade, troubleshoot visit) with starting-at pricing
- Photo cadence: 2–3 new per week, geotagged
- Confirm service-area: Mesa, Gilbert, Chandler, Tempe, Scottsdale, Apache Junction, Queen Creek, Phoenix

DAYS 30–90 · COMPOUND

Ramp velocity

- Target 4+ new Google reviews / month — drives current count to 25+ in 90 days
- Sustained 1–2 posts / week with project photos
- Sustained photo cadence — target 50+ total in 90 days
- Q&A monitoring <48 hours
- Track Local Pack for "electrician Mesa AZ", "EV charger installer Phoenix", "panel upgrade Mesa", "Tesla Wall Connector installer near me"

Crosswalk to the proposed Scope of Services

Stag's quote already commits to **Google Business Profile Optimization** (\$1,250 one-time). That line item covers the Week-1 work above — claim/rebuild, categories, attributes, service area, business description, Q&A seeding, review-response sweep, and the move to Google-specific review requests.

The ongoing posts cadence, photo cadence, and review-velocity ramp are best handled inside the **AEO Authority + Operations Retainer** (\$1,000/mo) — which already includes a review-velocity system and weekly performance summary.

This supplement reinforces the scope already in Stag's quote. It doesn't add new line items — it explains why the GBP optimization line is one of the highest-leverage in the bundle for an electrician in Stag's position.

BOTTOM LINE

The credentials are real. Once the GBP is properly built, they become visible.

Once categories are right, photos are uploaded, Q&A is seeded, and reviews flow on Google specifically — "electrician near me" and "EV charger install Phoenix" become winnable lanes inside 90 days.
